

README (SCENARIO I)

In the csv file “scenario01_transmission_tree_typical.csv”, you may find patient records that belong to a branch of the entire transmission tree for scenario I. The format of the data follows the same format of the patient records we provided for scenario I. The patient records in this file are supposed to be checked and documented with higher precision than in the patient database, without missing entries.

The starting point of the infection is at the early stage of the outbreak. The data file reports a typical transmission tree with interventions such as safe burial protocols at the beginning of the transmission and the appearance of Ebola Treatment Unit admissions at later stage of the transmission tree.
